Unit Ventilator System Without Reheat

Cooling Mode – When the room temperature is above set point:
- The room thermostat controls the air handler supply temperature by modulating it between 57 and 65 degrees. If room temperature is 79 degrees, the supply air is adjusted to 57 degrees. If the room temperature is 74 degrees, the supply air temperature is adjusted to 65 degrees.

Heating Mode – When the room temperature is below set point:
- The room thermostat controls the air handler supply temperature by modulating it between 80 and 85 degrees. If room temperature is 64 degrees, the supply air is adjusted to 85 degrees. If the room temperature is 67 degrees, the supply air temperature is adjusted to 80 degrees.
